Swift Observations of GRB 120218A

C. A. Wolf (PSU), D. Grupe (PSU), S. D. Barthelmy (NASA/GSFC), J.A. Kennea (PSU), D.N. Burrows (PSU), M.H. Siegel (PSU), and N. Gehrels (NASA/GSFC) for the Swift Team

1 Introduction

At 00:49:22 UT on 2012-02-18, the Swift Burst Alert Telescope (BAT) triggered and located GRB 120218A (trigger=515277). Swift did not slew due to a Sun constraint. Swift could not slew to the BAT position until 19:14 UT on 2012 March 20 (Wolf et al., GCN Circ. 12962).

The best Swift position of this burst is the BAT position given in Barthelmy et al. (GCN Circ. 12963) with RA-2000 = 21h 19m 03.4s, and Dec-2000 = −25° 27′ 45.4″ with an uncertainty of 1.9′.

2 BAT Observation and Analysis

At 00:49:22 UT on 2012-02-18, the Swift Burst Alert Telescope (BAT) triggered and located GRB 120218A (trigger=515277, Wolf et al., GCN Circ. 12962). Using the data set from T-239 to T+303 s, the BAT ground-calculated position is RA, Dec = 319.7641, -25.4626 deg which is RA(J2000) = 21h 19m 03.4s
Dec(J2000) = −25° 27′ 45.4″

with an uncertainty of 1.9 arcmin, (radius, sys+stat, 90% containment). The partial coding was 4% (Barthelmy et al. GCN Circ. 12963).

The mask-weighted light curve (Figure 1) shows 3 or 4 overlapping peaks starting at T-28 s, with the brightest peak at T+3 s, and ending at T+15 s. $T_{90}$ (15-350 keV) is 27.5±1.0 s (estimated error including systematics).

The time-averaged spectrum from T-20.6 to T+8.9 s is best fit by a simple power-law model. The power law index of the time-averaged spectrum is 1.75±0.11. The fluence in the 15-150 keV band is 5.3 ±0.4 × 10^{-6} erg cm^{-2} and the 1-sec peak flux measured from T+2.33 s in the 15-150 keV band is 9.1 ±1.2 photons cm^{-2} s^{-1}. All the quoted errors are at the 90% confidence level.

The results of the batgrbproduct analysis are available at http://gcn.gsfc.nasa.gov/notices_s/515277/BA/
